# **Definition**

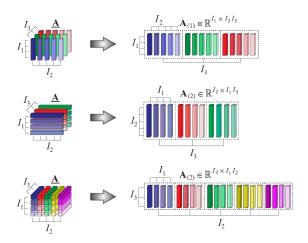

#### **Tensor**

► Tensor - multidimensional array

## Casting

- ► Tenzor  $\hat{X}$ , matrix M, vector  $\vec{y}$
- Strange special symbol  $\hat{1}_R^T$ :  $\sum_{i=1}^R y_i = \hat{1}_R^T \vec{y}$
- ▶ Outer product ∘
- ► Kronecker product ⊗
- ► Hadamarad product \*
- ► Khartri-rao product ⊙
- Frobenious norm  $\|\hat{X}\|_F = \sum_{i_1=1} \cdots \sum_{i_N=1} x_{i_1...i_N}$

## Matricization, Unfolding

### Vectorization

Isomorphism that maps the element of tensor to vector:

$$\mathbb{R}^{I_1 \times \cdots \times I_N} \rightarrow (I_1 \times \cdots \times I_N)$$

$$j = \sum_{k=0}^{N} i_k \prod_{m=k+1}^{N} I_m \tag{1}$$

$$\begin{pmatrix} a_0 & a_1 & a_2 \\ a_3 & a_4 & a_5 \\ a_6 & a_7 & a_8 \\ a_9 & a_{10} & a_{11} \end{pmatrix}$$

$$\begin{pmatrix} a_0 & a_1 & a_2 \\ a_3 & a_4 & a_5 \\ a_6 & a_7 & a_8 \\ a_9 & a_{10} & a_{11} \end{pmatrix}$$

Figure: Matlab

# Some vectorization properties

$$ightharpoonup \text{vec}(\mathbf{A}\mathbf{B}^T) = (\mathbf{B}\odot\mathbf{A})\mathbf{1}_R$$

$$\triangleright \operatorname{vec}(\mathbf{A}\operatorname{diag}(\mathbf{s})\mathbf{B}^T) = (\mathbf{B}\odot\mathbf{A})\mathbf{s}$$

$$\triangleright \operatorname{vec}(\mathbf{A}\mathbf{G}\mathbf{B}^T) = (\mathbf{B} \otimes \mathbf{A})\operatorname{vec}(\mathbf{G})$$

$$\blacktriangleright \ \mathsf{vec}(\mathbf{A}\circledast\mathbf{B}) = \mathsf{vec}(\mathbf{A})\circledast\mathsf{vec}(\mathbf{B})$$

$$\triangleright \ \mathsf{vec}(\mathsf{AB} - \mathsf{BA}) = (\mathsf{I} \otimes \mathsf{A} - \mathsf{A}^\mathsf{T} \otimes \mathsf{I}) \, \mathsf{vec}(\mathsf{B})$$

# Tensor reshaping operations

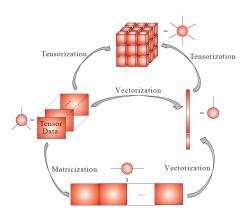

Figure: Tensor reshaping operations: Matricization, vectorization and tensorization. Matricization refers to converting a tensor into a matrix, vectorization to converting a tensor or a matrix into a vector, while tensorization refers to converting a vector, a matrix or a low-order tensor into a higher-order tensor.

# Outer product

Outer product of tensors N-order tensor  $\hat{A} \in \mathbb{R}^{I_1 \times I_2 \cdots \times I_N}$  and M-order tensor  $\hat{A} \in \mathbb{R}^{I_1 \times I_2 \cdots \times I_M}$  is a (N+M) order tensor  $\hat{C}$ :

$$c_{i_1...i_Nj_1...j_M} = a_{i_1...i_N}b_{j_1...j_M}$$
 (2)

- outer product change the number of dimensions, not dimensions!
- Outer product of  $\vec{a}$ ,  $\vec{b}$ ,  $\vec{c}$  forms a tensor X, with entries  $x_{ijk} = a_i \cdot b_j \cdot c_k$
- what is the rank of this tensor?

# Mode-n product

Mode-n product of tensor  $\hat{A} \in \mathbb{R}^{I_1 \times I_2 \times I_3 \cdots \times I_n \times I_N}$  and matrix  $B \in \mathbb{R}^{J \times I_n}$  tensor  $\hat{C} \in \mathbb{R}^{I1 \times I2 \times I3 \cdots \times J_N}$ , that has elements:

$$c_{i_1...i_{n-1}ji_{n+1}...j_N} = \sum_{i_n} a_{i_1...i_n...i_N} b_{ji_n}$$
 (3)

- n-mode product change the size of the corresponding tensor along the dimension n!
- n-mode product is the case of 3-d tensor is like matrix-matrix multiplication, where the second matrix is n-mode unfolding:

$$\hat{X} \times_n M = M \hat{X}_{[n]} \tag{4}$$

## Kronecker product, left Kronecker product

For an  $A \in \mathbb{R}^{I \times J}$  matrix a  $B \in \mathbb{R}^{K \times L}$ , the standard (Right) Kronecker product,  $A \otimes_L B$ , and the Left Kronecker product,  $A \otimes_L B$ , are the following  $\mathbb{R}^{IK \times JL}$  matrices

$$C = \begin{bmatrix} a_{11}B & a_{12}B & \dots \\ \vdots & \ddots & \\ a_{J1}B & & a_{IJ}B \end{bmatrix}$$

$$C_L = \begin{bmatrix} b_{11}A & b_{12}A & \dots \\ \vdots & \ddots & \\ a_{J1}A & & b_{KL}A \end{bmatrix}$$

# Kronecker product, left Kronecker product

### **Properties**

- $(A \otimes B)^T (C \otimes D) = (A^T C) \otimes (B^T D)$
- $(A \otimes B)(E \odot F) = (AE) \odot (BF)$

# Khartri-Rao product

### Khartri-Rao product

- ▶ Given matrix  $A \in \mathbb{R}^{I \times R}$  and  $B \in \mathbb{R}^{J \times R}$

### **Properties**

- $(A \odot B)^T (A \odot B) = A^T A * B^T B$
- $(\mathbf{A} \odot \mathbf{B})^{\dagger} = ((A^{T}A) * (B^{T}B))^{-1}(\mathbf{A} \odot \mathbf{B})^{T}$

### Hadamarad Product

#### Hadamarad Product

► Elementwise product of the objects with the same order and the same size

# CP decomposition

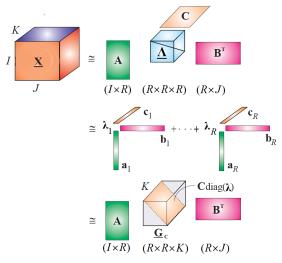

#### Kruskal Tensor

Kruskal tensor - tensor which be expressed as a finite sum of rank-1 tensors, in the form

$$\hat{X} = \sum_{r=1}^{R} \lambda_r \vec{b_1} \circ \vec{b_2} \cdots \circ \vec{b_n}$$
 (5)

It also known under the names of CANDECOMP / PARAFAC, Canonical Polyadic Decomposition (CPD), or simply the CP decomposition.

# CP decomposition

# CP decomposizition

#### Tensor Rank

The tensor rank, also called the CP rank, is a natural extension of the matrix rank and is defined as a minimum number, R, of rank-1 terms in an exact CP decomposition of the form in

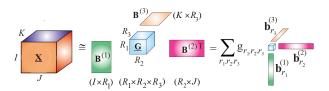

### Best Decomposition

- If we define Norm |||| function, the best rank-r approximation is argmin  $||Y \hat{Y}||$
- ▶ For tensors of dimensions >= 3 this argmin can not exists
- therefore, not every tensor has the rank
- more in https://arxiv.org/pdf/math/0607647.pdf

# Tucker decomposition

$$\hat{X} = \sum_{r_1=1}^{R_1} \sum_{r_2=1}^{R_N} g_{r_1,r_2..r_n} \vec{b_1} \circ \vec{b_2} \cdots \circ \vec{b_n}$$
 (6)

#### Scheme of the Tucker decomposition

# TuckerCP decomposition

### Properties of decomposition

CP	Tucker
Scalar product	
$x_{i_1,\dots,i_N} = \sum_{r=1}^R \lambda_r \ b_{i_1,r}^{(1)} \cdots b_{i_N,r}^{(N)} \qquad x_{i_1,\dots,i_N} = \sum_{r_1=1}^{R_1} \cdots \sum_{r_N=1}^{R_N} g_{r_1,\dots,r_N} \ b_{i_1,r_1}^{(1)} \cdots b_{i_N,r_N}^{(N)}$ Outer product	
Outer product	
$\underline{\mathbf{X}} = \sum_{r=1}^{R} \lambda_r \ \mathbf{b}_r^{(1)} \circ \cdots \circ \mathbf{b}_r^{(N)}$	$\underline{\mathbf{X}} = \sum_{r_1=1}^{R_1} \cdots \sum_{r_N=1}^{R_N} g_{r_1,\dots,r_N} \ \mathbf{b}_{r_1}^{(1)} \circ \cdots \circ \mathbf{b}_{r_N}^{(N)}$
Multilinear product	
4) 0	
$\underline{\mathbf{X}} = \underline{\mathbf{\Lambda}} \times_1 \mathbf{B}^{(1)} \times_2 \mathbf{B}^{(2)} \cdots \times_N \mathbf{B}^{(N)}$	$\underline{\mathbf{X}} = \underline{\mathbf{G}} \times_1 \mathbf{B}^{(1)} \times_2 \mathbf{B}^{(2)} \cdots \times_N \mathbf{B}^{(N)}$
$\underline{\mathbf{X}} = \left[\!\!\left[\underline{\mathbf{\Lambda}}; \mathbf{B}^{(1)}, \mathbf{B}^{(2)}, \dots, \mathbf{B}^{(N)}\right]\!\!\right]$	$\underline{\mathbf{X}} = \left[\!\!\left[\underline{\mathbf{G}}; \mathbf{B}^{(1)}, \mathbf{B}^{(2)}, \dots, \mathbf{B}^{(N)}\right]\!\!\right]$
Vectorization	
$\operatorname{vec}(\underline{\mathbf{X}}) = \left(\bigcup_{n=N}^{1} \mathbf{B}^{(n)}\right) \lambda$	$\operatorname{vec}(\underline{\mathbf{X}}) = \left(\bigotimes_{n=N}^{1} \mathbf{B}^{(n)}\right) \operatorname{vec}(\underline{\mathbf{G}})$
Matricization	
$\mathbf{X}_{(n)} = \mathbf{B}^{(n)} \mathbf{\Lambda} \begin{pmatrix} 1 \\ \underbrace{0}_{m=N, \ m \neq n} \mathbf{B}^{(m)} \end{pmatrix}^{\mathrm{T}}$	$\mathbf{X}_{(n)} = \mathbf{B}^{(n)} \mathbf{G}_{(n)} \left( \bigotimes_{m=N, \ m \neq n}^{1} \mathbf{B}^{(m)} \right)^{\mathrm{T}}$
$\mathbf{X}_{< n>} = (\bigodot_{m=n}^{1} \mathbf{B}^{(m)}) \mathbf{\Lambda} (\bigodot_{m=N}^{n+1} \mathbf{B}^{(m)})^{T},$	$\mathbf{X}_{< n>} = (\bigotimes_{m=n}^{1} \mathbf{B}^{(m)}) \mathbf{G}_{< n>} (\bigotimes_{m=N}^{n+1} \mathbf{B}^{(m)})^{\mathrm{T}}$

## **ALS**

We have tensor  $\hat{T}$  and want to find it's CPD decomposition  $\hat{T} = [|\hat{U}^{(1)}\hat{U}^{(2)}\hat{U}^{(3)}|]$ , i.e find  $\hat{U}^{(1)}, \hat{U}^{(2)}, \hat{U}^{(3)}$ 

- We can define every factor matrix from initial tensor  $\hat{T}$  and another factor matrices
- We can obtain this definition from LLS(Linear least squares)
- On the zero step we initialize factor matrices
- Every step consists of number<sub>o</sub> f<sub>f</sub> actorssubstepForeverysubstepweupdateoneoffactormatricesinassur
- Do until given number of iteration is reached, or given accuracy is reached
